# Gaussian Naïve Bayes

Nazerfard, Ehsan nazerfard@aut.ac.ir

# Gaussian/Normal Distribution

A lot of things in nature follow the normal distribution, such as people's height, etc.

#### Gaussian Distribution

- A type of continuous distribution
- (Univariate) probability density function:

$$f(x) = \frac{1}{\sqrt{2\pi\sigma^2}} e^{-\frac{1}{2}\left(\frac{x-\mu}{\sigma}\right)^2}$$

• where  $\mu$  and  $\sigma^2$  are the mean and variance of the distribution.

# Gaussian Distribution (cont.)

(Multivariate) probability density function:

$$f_{\mathbf{X}}(x_1, ..., x_k) = \frac{1}{\sqrt{(2\pi)^k |\Sigma|}} e^{-\frac{1}{2}(\mathbf{X} - \mu)^T \Sigma^{-1} (\mathbf{X} - \mu)}$$
$$\mathbf{X} = (X_1, ..., X_k)^T$$

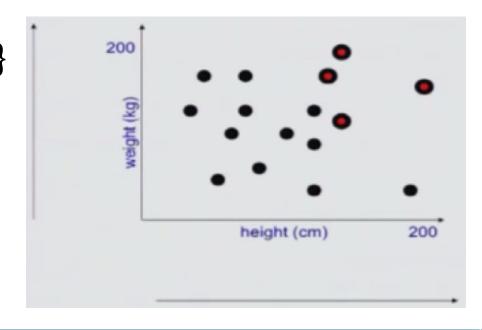

• where  $\mu_{k\times 1}$  and  $\Sigma_{k\times k}$  are the mean vector and covariance matrix of the distribution:

• 
$$\boldsymbol{\mu} = \mathbb{E}[\mathbf{X}] = \left[\mathbb{E}[X_1], \dots, \mathbb{E}[X_k]\right]^T$$

• 
$$\Sigma = \mathbb{E}[(\mathbf{X} - \boldsymbol{\mu})(\mathbf{X} - \boldsymbol{\mu})^{\mathrm{T}}]$$

# Gaussian naïve Bayes (GNB)

- How to distinguish <u>children</u> from <u>adults</u>, using a Gaussian naïve Bayes classifier?
  - o Classes: {a,c}
  - Features: <u>h</u>eight and <u>w</u>eight (continuous inputs)
- □ Training data  $\{h_i, w_i, y_i\}$ 
  - o 12 <u>c</u>hildren (black)
  - 4 <u>a</u>dults (red)

#### **Prior Probabilities**

#### Prior class probabilities:

$$p(Y = a) = 4/16 = 0.25$$

$$p(Y = c) = 12/16 = 0.75$$

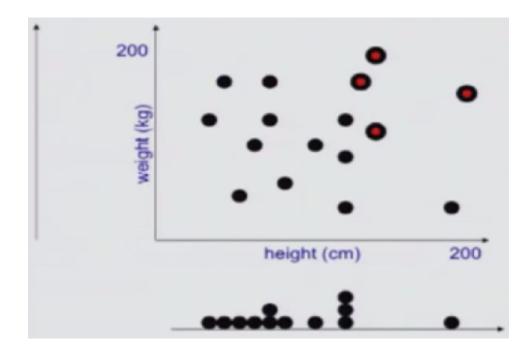

Figure  $\ensuremath{\mathbb{C}}$  Victor Lavrenko, Lecture on GNB, University of Edinburgh

# Children's Features

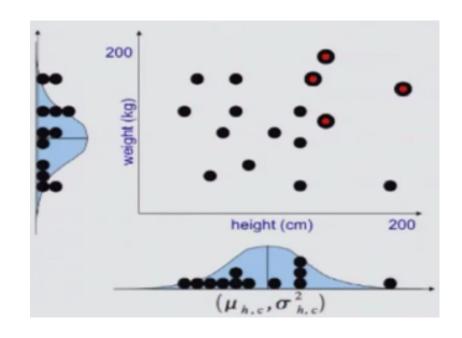

Assuming that children's heights and weights follow the Gaussian distribution:

$$\circ \mu_{h,c} = \frac{1}{12} \sum_{i:y_i=c} h^i$$

$$\sigma_{h,c}^{2} = \frac{1}{12-1} \sum_{i:y_{i}=c} (h^{i} - \mu_{h,c})^{2}$$

$$0 \mu_{w,c} = \frac{1}{12} \sum_{i:y_i=c} w^i$$

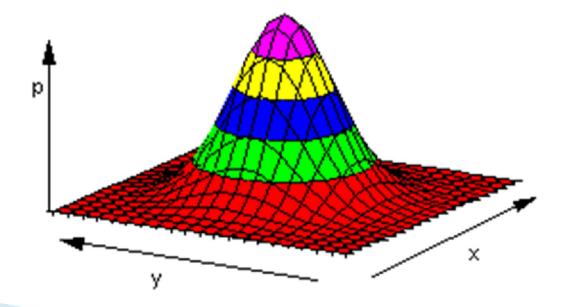

$$\sigma_{w,c}^2 = \frac{1}{12-1} \sum_{i:y_i=c} (w^i - \mu_{w,c})^2$$

#### 2-Dimensional Gaussian Distribution

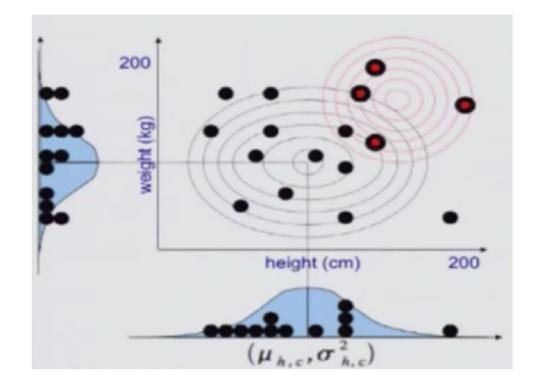

$$\boldsymbol{\mu} = \begin{bmatrix} \mu_X \\ \mu_Y \end{bmatrix}, \ \boldsymbol{\Sigma} = \begin{bmatrix} \sigma_X^2 & \rho \sigma_X \sigma_Y \\ \rho \sigma_X \sigma_Y & \sigma_Y^2 \end{bmatrix}$$

where  $\rho = \frac{Cov(X,Y)}{\sigma_X \sigma_Y}$  is the correlation coefficient between X and Y.

# Independence Assumption

Multiplying two Gaussian distributions

The same thing for the adult's features

#### **Test Phase**

 $\square X = \langle h_X, w_X \rangle$  (test data)

$$p(h_X|Y=a) = \frac{1}{\sqrt{2\pi\sigma_{h,a}^2}} \exp(-\frac{(h_X - \mu_{h,a})^2}{2\sigma_{h,a}^2})$$

$$p(w_X|Y=a) = \frac{1}{\sqrt{2\pi\sigma_{w,a}^2}} \exp(-\frac{(w_X - \mu_{w,a})^2}{2\sigma_{w,a}^2})$$

■ Similarly compute  $p(h_X|Y=c)$  an  $dp(w_X|Y=c)$ 

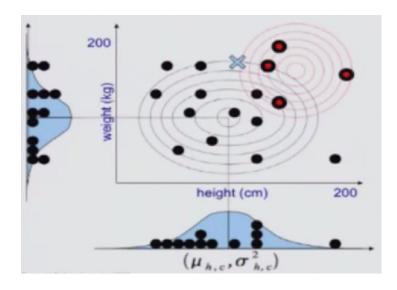

Figure © Victor Lavrenko, Lecture on GNB, University of Edinburgh

#### Classification

Classification Rule:

$$y_{MLE} = \underset{y \in \{a,c\}}{\operatorname{argmax}} \ p(Y = y | X) = \underset{y \in \{a,c\}}{\operatorname{argmax}} \ p(X | Y = y) \ p(Y = y)$$

 $\square$  Test data:  $X = \langle h_X, w_X \rangle$ 

If 
$$p(\langle h_X, w_X \rangle | Y = a) p(Y = a) > p(\langle h_X, w_X \rangle | Y = c) p(Y = c)$$

In depen assumption

If 
$$p(h_X|Y=a) p(w_X|Y=a) p(Y=a) > p(h_X|Y=c) p(w_X|Y=c) p(Y=c)$$

Then Class is <u>a</u>dult

Else Class is children

#### A Gentle Correction

Population mean vs. Sample mean

$$\mu_{h,c} = \frac{1}{12} \sum_{i:y_i=c} h^i \to \bar{X}_{h,c} = \frac{1}{12} \sum_{i:y_i=c} h^i$$

Population variance vs. Sample variance

$$\sigma_{h,c}^2 = \frac{1}{12 - 1} \sum_{i: y_i = c} (h^i - \mu_{h,c})^2 \to S_{h,c}^2 = \frac{1}{12 - 1} \sum_{i: y_i = c} (h^i - \bar{X}_{h,c})^2$$

#### Parametric Form of P(Y|X) for GNB Classifier

- Assumptions
  - Y is boolean, governed by a Bernoulli distribution
  - $\circ$   $X = < X_1, X_2, ..., X_n >$ , where  $X_i$  is a continuous random variable
  - For each  $X_i$ ,  $P(X_i|Y=y_k)$  is a Gaussian distribution of the form  $N(\mu_{ik}, \sigma_i)$
  - For all i and  $j \neq i$ ,  $X_i$  and  $X_j$  are conditionally independent given Y

■ We derive the parametric form of p(Y|X) that follows from the set of GNB assumptions:

$$p(Y=1|X) = \frac{p(X|Y=1)p(Y=1)}{p(X)} = \frac{p(X|Y=1)p(Y=1)}{p(X|Y=1)p(Y=1) + p(X|Y=0)p(Y=0)}$$

$$= \frac{1}{1 + \frac{p(X|Y=0)p(Y=0)}{p(X|Y=1)p(Y=1)}}$$

■ We derive the parametric form of p(Y|X) that follows from the set of GNB assumptions:

$$p(Y = 1|X) = \frac{p(X|Y = 1)p(Y = 1)}{p(X)} = \frac{p(X|Y = 1)p(Y = 1)}{p(X|Y = 1)p(Y = 1) + p(X|Y = 0)p(Y = 0)}$$

$$= \frac{1}{1 + \frac{p(X|Y = 0)p(Y = 0)}{p(X|Y = 1)p(Y = 1)}} = \frac{1}{1 + \exp[\ln\frac{p(X|Y = 0)p(Y = 0)}{p(X|Y = 1)p(Y = 1)}]}$$

$$= \frac{1}{1 + \exp[\ln\frac{p(X|Y = 0)}{p(X|Y = 0)} + \ln\frac{p(Y = 0)}{p(Y = 1)}]} = \frac{1}{1 + \exp[\sum_{i=1}^{n} \ln\frac{p(X_i|Y = 0)}{p(X_i|Y = 1)} + \ln\frac{p(Y = 0)}{p(Y = 1)}]}$$
(Eq. I)

The sigma term in the denominator:

$$\sum_{i=1}^{n} \ln \frac{p(x_i|Y=0)}{p(x_i|Y=1)} = \sum_{i} \ln \frac{\frac{1}{\sqrt{2\pi\sigma_i^2}} \exp(\frac{-(X_i - \mu_{i0})^2}{2\sigma_i^2})}{\frac{1}{\sqrt{2\pi\sigma_i^2}} \exp(\frac{-(X_i - \mu_{i1})^2}{2\sigma_i^2})}$$

$$= \sum_{i} \ln \left( \exp \left( \frac{(X_i - \mu_{i1})^2 - (X_i - \mu_{i0})^2}{2\sigma_i^2} \right) \right) = \sum_{i} \frac{\left( X_i^2 - 2X_i \mu_{i1} + \mu_{i1}^2 \right) - (X_i^2 - 2X_i \mu_{i0} + \mu_{i0}^2)}{2\sigma_i^2}$$

$$=\sum_{i}\frac{2X_{i}(\mu_{i0}-\mu_{i1})+\mu_{i1}^{2}-\mu_{i0}^{2}}{2\sigma_{i}^{2}}$$

The sigma term in the denominator:

$$\sum_{i=1}^{n} \ln \frac{p(x_i|Y=0)}{p(x_i|Y=1)} = \sum_{i} \ln \frac{\frac{1}{\sqrt{2\pi\sigma_i^2}} \exp(\frac{-(X_i - \mu_{i0})^2}{2\sigma_i^2})}{\frac{1}{\sqrt{2\pi\sigma_i^2}} \exp(\frac{-(X_i - \mu_{i1})^2}{2\sigma_i^2})}$$

$$= \sum_{i} \ln \left( \exp \left( \frac{(X_i - \mu_{i1})^2 - (X_i - \mu_{i0})^2}{2\sigma_i^2} \right) \right) = \sum_{i} \frac{\left( X_i^2 - 2X_i \mu_{i1} + \mu_{i1}^2 \right) - (X_i^2 - 2X_i \mu_{i0} + \mu_{i0}^2)}{2\sigma_i^2}$$

$$= \sum_{i} \frac{2X_{i}(\mu_{i0} - \mu_{i1}) + \mu_{i1}^{2} - \mu_{i0}^{2}}{2\sigma_{i}^{2}} = \sum_{i} \left( \frac{\mu_{i0} - \mu_{i1}}{\sigma_{i}^{2}} X_{i} + \frac{\mu_{i1}^{2} - \mu_{i0}^{2}}{2\sigma_{i}^{2}} \right) \text{ (Eq. II)}$$

I, II 
$$\Rightarrow p(Y = 1|\mathbf{X}) = \frac{1}{1 + \exp[\sum_{i=1}^{n} \left(\frac{\mu_{i0} - \mu_{i1}}{\sigma_{i}^{2}} X_{i} + \frac{\mu_{i1}^{2} - \mu_{i0}^{2}}{2\sigma_{i}^{2}}\right) + \ln \frac{p(Y = 0)}{p(Y = 1)}}$$

I, II 
$$\Rightarrow p(Y = 1|\mathbf{X}) = \frac{1}{1 + \exp[\sum_{i=1}^{n} \left(\frac{\mu_{i0} - \mu_{i1}}{\sigma_{i}^{2}} X_{i} + \frac{\mu_{i1}^{2} - \mu_{i0}^{2}}{2\sigma_{i}^{2}}\right) + \ln \frac{p(Y = 0)}{p(Y = 1)}}]$$

#### Or equivalently:

$$p(Y = 1|X) = \frac{1}{1 + \exp(\sum_{i=1}^{n} w_i X_i + w_0)}$$

where 
$$w_i = \frac{\mu_{i0} - \mu_{i1}}{\sigma_i^2}$$
,  $w_0 = ln \frac{1 - P(Y=1)}{P(Y=1)} + \sum_{i=1}^n \frac{\mu_{i1}^2 - \mu_{i0}^2}{2\sigma_i^2}$ 

I, II 
$$\Rightarrow p(Y = 1|\mathbf{X}) = \frac{1}{1 + \exp[\sum_{i=1}^{n} \left(\frac{\mu_{i0} - \mu_{i1}}{\sigma_{i}^{2}} X_{i} + \frac{\mu_{i1}^{2} - \mu_{i0}^{2}}{2\sigma_{i}^{2}}\right) + \ln \frac{p(Y = 0)}{p(Y = 1)}}]$$

#### Or equivalently:

$$p(Y = 1|X) = \frac{1}{1 + \exp(\sum_{i=1}^{n} w_i X_i + w_0)}$$

where 
$$w_i = \frac{\mu_{i0} - \mu_{i1}}{\sigma_i^2}$$
,  $w_0 = ln \frac{1 - p(Y=1)}{p(Y=1)} + \sum_{i=1}^n \frac{\mu_{i1}^2 - \mu_{i0}^2}{2\sigma_i^2}$ 

$$p(Y = 0|\mathbf{X}) = 1 - p(Y = 1|\mathbf{X}) = \frac{\exp(\sum_{i=1}^{n} w_i X_i + w_0)}{1 + \exp(\sum_{i=1}^{n} w_i X_i + w_0)}$$

If 
$$p(Y = 1|X) \ge p(Y = 0|X)$$
 Then Class is +

If 
$$\frac{p(Y=1|X)}{p(Y=0|X)} = \frac{1}{\exp(\sum_{i=1}^{n} w_i X_i + w_0)} \ge 1$$
 Then Class is +

If 
$$p(Y = 1|X) \ge p(Y = 0|X)$$
 Then Class is +

If 
$$\frac{p(Y=1|X)}{p(Y=0|X)} = \frac{1}{\exp(\sum_{i=1}^{n} w_i X_i + w_0)} \ge 1$$
 Then Class is +

If 
$$\exp(\sum_{i=1}^{n} w_i X_i + w_0) \le 1$$
 Then Class is +

If 
$$\sum_{i=1}^{n} w_i X_i + w_0 \le 0$$
 Then Class is +; Else Class is -

If 
$$p(Y = 1|X) \ge p(Y = 0|X)$$
 Then Class is +

If 
$$\frac{p(Y=1|X)}{p(Y=0|X)} = \frac{1}{\exp(\sum_{i=1}^{n} w_i X_i + w_0)} \ge 1$$
 Then Class is +

If 
$$\exp(\sum_{i=1}^{n} w_i X_i + w_0) \le 1$$
 Then Class is +

If 
$$\sum_{i=1}^{n} w_i X_i + w_0 \le 0$$
 Then Class is +; Else Class is -

Therefore, naïve Bayes learning algorithm can be viewed as a linear classifier, under the assumption that variance of each feature is independent of the class (i.e if  $\sigma_{ik} = \sigma_i$ ).
